

WOODLAND SUITABILITY GROUP 7

These soils have moderately high site indexes, severe equipment limitations, severe insect and disease hazards, and severe windthrow hazard. They have a severe limitation for growing Christmas trees.

The soils in this group are the poorest soils in the survey area for woodland uses and only such extensive management practices as fire protections, pest and disease controls, and protection from overgrazing and erosion are generally practical. More intensive measures are warranted in places however, if they increase value for recreation or as wildlife habitat.
